

Azure Architecture

Note:-

1. We can make any type of architecture e.g. only one subscription with resource groups for medical retail etc separately.

2. Why resources in the same account need to interact via security keys?

To help out administrator to provide specific (e.g) accesses to medical data analyst and to retail data analyst separately.

How these resources interact?

Resources within the same resource group or in different resource group or even in different resource groups from different azure account; interact with each other through access keys, SAS, Tokens, Service principal Azure AD etc.
